## **Dedication**

We dedicate our dissertation work to our loving parents and special gratitude to our respectful teachers, a warm gratitude to our family members and friends, whose words of encouragement and push for tenacity ring in our ears. Without their cooperation it would have not been possible to complete the graduation and make them feel proud.

We also dedicate this dissertation to our friends who have supported us throughout the process in any way. We will always appreciate all they have done and how they supported us.

## Acknowledgment

First and the foremost, we wish to express our deepest gratitude to our project supervisor Mam Emmen Farooq for the continuous support in our BS studies and in final year project, for her patience, motivation, enthusiasm and immense knowledge. Her guidance helped us all the time in the final year project and the writing of this thesis. Without her this thesis would not have been completed.

Besides Our project supervisor we would like to thank some other teachers including Sir Zeeshan Khan for his encouragement and insightful comments related to our studies and project. We also would like to pay u gratitude to Dr. Adnan Abid for his kind and motivational words and actions which encourages us to work on this project and complete.

We also would like to thank all the respected teachers of computer science department for their guidance in every way they guide us and make us worthy to complete this thesis.

## **Abstract**

Our project Order Time is a pre reservation android and web service project with a user friendly and easy to learn android application and website through which user can place their order before and reserve their table online to save time. It includes a google map representation on nearby restaurants and a simple search facility to find the desire place. Signed in is possible by Facebook or by email and password. Using this service restaurant owner can modify their menu online in real time. All the data can be retrieved easily because of the generic online database Firebase by google along with a full encryption system keeping all the data secure without slowing down the system

# 1. INTRODUCTION

This is web-android base project which will provide the customer to give a pre-order before their departure from their current place to the restaurant or fast food joint and the facility of pre-served before their arrival at the restaurant or fast food joint

## 1.1 Motivations

Today's world is depending on technology. Everything is transforming. Time is the most important and expensive thing. Finding time for lunch or finding enough time to get out from work space, get to a restaurant, order food, eat and then come back to the workplace is close to impossible.

## 1.2 Project Overview

This application will only provide the facility to view and place the order to specific restaurant for a customer and for the restaurant sponsors this application will provide the facility to upload/edit their menu and view current orders with their countdown and customers status. This website will use android and web

It will consist of 3 different interfaces

1. Main admin (Web Based)
2. Restaurant admin (Web Based)
3. Customer (Android/Web Based)

The Main admin will have the functionality related to registering a new restaurant and providing them the facility to make a new menu, add pictures, add prices and monitor their customers.

The Restaurant's admin can update their menu, add prices and monitor their customers' orders and total orders placed in a day and in a week and a month. It will allow them to see their regular customers and update records.

The customer will be able to see the restaurant. The interface will have the category of food, this means that the customer can select which type of cuisine he wants and it will list all the restaurants'. It will also have a budget amount setting which will help locate him a restaurant that lies in his budget range. Select a restaurant, place order, see the bill, place reservation and place the time at which they will be visiting. The application will also include maps, the maps will help locate the restaurant and provide an estimate time for arrival from their location.

### 1.3 Problem Statement

The biggest issue of going to a restaurant is the issue of time, sometimes the restaurant does not have any availability and sometimes due to short break in between work an hour is not sufficient enough to have a good meal with friends or family.

### 1.4 Objectives

- To provide a user friendly application
- To provide user a facility to check if seating in a restaurant is available or not
- To solve the time shortage issue of students and customers
- To increase the business of restaurant
- To help customer find and visit different restaurant which are nearby
- To advertise restaurants
- To provide an application interface for restaurants to interact with their customers

## 2. DOMAIN ANALYSIS

### 2.1 Customer

Every person who has less than or equal to one hour for lunch break is a potential customer of our system. Moreover the restaurant owner who are willing to join our system for the ease of their customer are also included in the group of the customers (i.e. HATS fast food joint which is the sponsor of our project). At this moment we are developing the system for the following

1. Students
2. Office Workers
3. Restaurant Owners
4. People who like to go and dine out

### 2.2 Stakeholders

*Table 1 Stakeholder*

<i>Stakeholder</i>	<i>Role in System</i>
Admin	Responsible for giving access to new restaurants. In case of late payment or rule violation by any of the restaurant it is his responsibility to freeze their account. Moreover it is his responsibility to look over the customer reported by the restaurants and block their account if the customer is reported more than 2 times
Restaurant Owner	He is responsible for serving the food order with the desire requirements of the customer in time after accepting the order on the website. In the case of low staff of any other issue it is the responsibility to decline the order on the website so that the customer can be notified
Customer	He is responsible for placing the order using mobile application or website. In case of decline of the order customer is responsible to report or rate the restaurant so that admin can take appropriate action against them

**Table 2: list of stakeholders**

## 2.3 Affected Groups with social or economic impact

By the development of the system the customer will have social benefits due to less time consumption whereas the restaurant owner will get the economic benefit as this system will increase their business

## 2.4 Dependencies/ External Systems

- Firebase

## 2.5 Reference Documents

### 2.5.1 Related Projects

In order to develop Order Time, we looked up several similar system. Their details are given bellow

1. FoodPanda([www.foodpanda.pk](http://www.foodpanda.pk))
2. EatOye ([www.eatoye.pk](http://www.eatoye.pk))
3. McDelivery (<http://www.mcdonalds.com.pk/>)

### 2.5.2 Feature Comparison

*Table 2 Feature Comparison*

<i>Sr. No.</i>	<i>Comparison Feature</i>	<i>FoodPanda</i>	<i>EatOye</i>	<i>McDelivery</i>	<i>Order time</i>
1	Login	FoodPanda covers the login feature completely as desired	EatOye covers the login feature completely as desired	McDelivery covers the login feature completely as desired	Order time covers the login feature completely as desired
2	Sign Up	FoodPanda covers the sign up feature	EatOye covers the sign up feature	McDelivery covers the sign up feature	Order time covers the sign up feature

		completely as desired	completely as desired	completely as desired	completely as desired
3	Restaurant Search	FoodPanda covers the RS feature completely as desired	EatOye covers the RS feature completely as desired	McDelivery don't cover the RS feature as it covers only one fast food joint	Order Time covers the RS feature completely as desired
4	Preserve	FoodPanda don't cover this feature	EatOye don't cover this feature	McDelivery don't cover this feature	Order Time covers the preserve feature completely as desired
5	Order Cart	FoodPanda do this for multiple restaurant	EatOye do this for multiple restaurant	McDelivery covers this for only one specifically McDonald's	Order time do this for only restaurant per order but it is not limited to only one restaurant
6	Categorize Search	Food panda search by location	EatOye search by location	McDelivery search by location	Order Time can search by location ,craving and city

## 3. REQUIREMENTS ANALYSIS

### 3.1 Requirements

#### 3.1.1 Functional Requirements

●It will provide the restaurant owner to add a menu, update menu and remove an item from menu.

●It will provide restaurant owner to check total orders.

●It will provide admin facility to accept or decline an order.

●It will provide the restaurant owner to request ban a customer from ordering if he fails to show up 3 times.

●It will provide the restaurant owner to view the record of a customer.

●It will provide a customer to view menu and place order

●It will provide customer to sign up or login.

●It will provide customer the facility to reserve a table

●It will provide customer to set a time for arrival

●It will provide customer the location of restaurant that he ordered at

●It will provide customer an estimated time to reach his destination

●It will provide customer to rate a restaurant and provide a feedback

●It will provide customer his total bill

●It will provide the facility to choose between fast food and restaurant and further categories of restaurants if restaurant category has been chosen

●It will provide the user to request ban on a restaurant if it decline his order

#### 3.1.2 Non-Functional Requirements

●Secure access of all the data as separate login pages to different user members

● 24/7 availability of system

● Flexibility of system is highly desirable for future extension.

### 3.1.3 Data Requirements

- Data will be stored online in the online database provided by google know as Firebase which will be accessed by both the website and the android application

### 3.1.4 Constraints

- Every customer must login before final placement of the order
- Admin side should be highly secured.

### 3.1.5 External Interface Requirement

- Two components of the system (Android application and Website) both will be continuously checking the database (Firebase) for any change. In other words the database will work as a hub and any change in it by any component will trigger some functions in both components through which data will be communicated

## 3.2 List of Actors

- Admin
- Customer
- Restaurant Owner

## 3.3 List of use case

- Log In: allow user to provide account information and access the restricted services.
- Add,-Delete-And-Update-Restaurant: staff can add new restaurants delete restaurants and update restaurants.
- View-Ban-Request: admin can see customer ban request from the restaurant.
- View Order: staff member of the restaurant can see all the detail of the customer order.
- Order Decline: staff can decline the order for any reasons.
- Report User: they can send report to the admin.
- Edit Menu: they can add delete and update the menu.
- Search-Restaurant: customer can search restaurant by name of restaurant or food type.
- Place-Order: using the application on mobile or website the customer can place his order and the order will be confirmed by the restaurant.
- Feedback: the customer can write his experience with the community of people using the application or website.

- Search-deals: the customer can directly write a deal he wants in the search box and will get a result back showing results
- Report-Restaurant: the customer can report a restaurant if the service was not up to the mark or the order was delayed or it was not the order they asked for,

### 3.4 System use case diagram

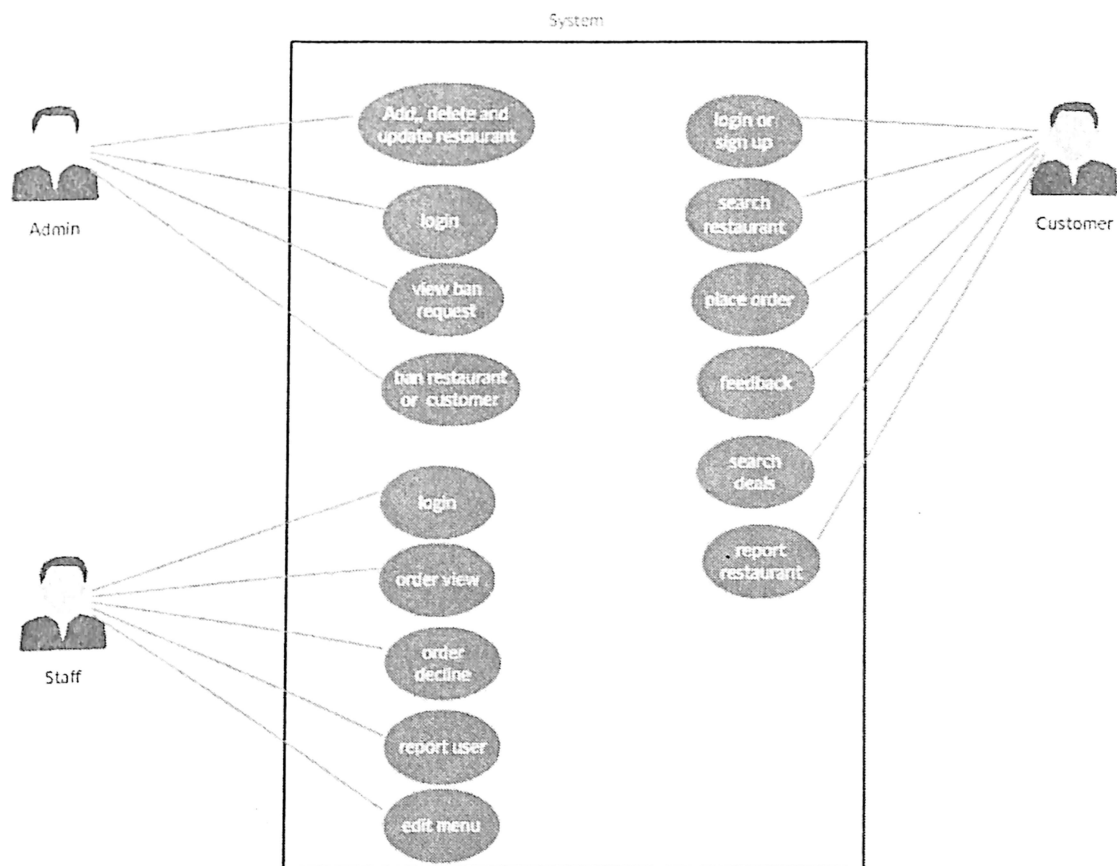

Figure 1 System Use Case Diagram

### 3.5 Extended use cases

*Table 3 Use Case 1 Login*

Name	Log in the application and web
ID	1.1
Description	The user will login in the system to get the access level of the user and that we save the record of the user
Actors	Admin, customer and staff
Frequency of use	High
Triggers	When user will try to use the application and web page
Pre-conditions	<ol style="list-style-type: none"><li>1. Internet access</li><li>2. User already sign up</li><li>3. User need to have application installed in mobile</li></ol>
Post conditions	<ol style="list-style-type: none"><li>1. User have valid username and password</li><li>2. User login in the system</li></ol>
Normal Flow	<ol style="list-style-type: none"><li>1. Install the application</li><li>2. Sign up</li><li>3. Click on login</li><li>4. Give valid username and password</li></ol>

	<p>5. System will check if given password and username is in database and valid</p> <p>6. System will give access to user</p>
Alternative flow	<p>3a) if the user doesn't sign up and try to login in</p> <ol style="list-style-type: none"> <li>1. User need to go and sign up first</li> <li>2. User will give username and password and valid email</li> <li>3. Username and password saved in the database</li> <li>4. Use case remain on step number 4</li> </ol>
Exceptions	<p>4 a) Give valid username and password</p> <ol style="list-style-type: none"> <li>1. If the username or password is invalid</li> <li>2. show the message that password or username is invalid</li> <li>3. user will retry and entry username and password or go sign up if it is not already done</li> </ol>
Assumptions	User will login in the system
Special requirements	N/A
Notes and Issues	N/A

Table 4 Use Case 2 Add/Delete Restaurant

Name	Add, delete or update restaurant
ID	1.2
Description	The admin can add new restaurants so they can be ordered through our app and the admin can delete or update existing restaurants
Actors	Admin
Organizational Benefits	More restaurants can be added and the ones that don't exist can be deleted
Frequency of use	Medium
Triggers	When ne restaurant is added or when existing record is updated or deleted
Pre-conditions	<ol style="list-style-type: none"> <li>1) Internet access</li> <li>2) Admin logged in</li> <li>3) For adding restaurant should not be already in the restaurant list</li> <li>4) Updating or deleting a restaurant should exist in the restaurant list</li> </ol>
Post conditions	<ol style="list-style-type: none"> <li>1) Restaurant added in the list</li> <li>2) If restaurant deleted, it is removed from the list</li> <li>3) If restaurant updated, it is updated in the list</li> </ol>
Normal flow	<ol style="list-style-type: none"> <li>1) Admin logged in</li> <li>2) Admin will choose the option from delete, add and update</li> </ol>

	<p>3) For adding new restaurant, write name of restaurant and details and press add button restaurant will add in the database</p> <p>4) If deleting a restaurant, find restaurant from list and press delete button Restaurant will be delete from database</p> <p>5) If updating a restaurant, find restaurant from list press update. Do the changes and press the save button</p>
Alternative Flow	<p>3a) adding restaurant</p> <p>1) If the restaurant is already added when we add</p> <p>2) Show the message that restaurant already exists in list</p> <p>3) Use case reuse from step 4</p>
Exceptions	<p>4a) deleting restaurant</p> <p>1) entry the name of the restaurant does not exist in the restaurant list</p> <p>2) show the message that restaurant is not in the list</p>
Assumption	Restaurant query will work correctly

Special requirements	N/A
Notes and Issues	N/A

Table 5 Use Case 3 Ban Restaurant/Custome

Name	ban restaurant or customer
ID	1.3
Description	The admin can accept the ban request. The banned restaurant or customer will no longer have access to the app and cant order anything
Actors	Admin
Frequency of use	Medium
Triggers	When a customer or restaurant sends a ban request
Pre-conditions	Customer and the restaurant must be registered in the system and a valid reason provided for the ban
Post conditions	The customer or the restaurant will be banned and can't use any services
Normal Flow	<ol style="list-style-type: none"> <li>1) Admin log in</li> <li>2) View request</li> <li>3) Check if the customer or restaurant is registered with the system</li> <li>4) Check reason for ban</li> <li>5) Add name and id</li> <li>6) Click ban</li> <li>7) Pop up will show banned</li> </ol>
Alternative Flow	<p>1 a)admin log in</p> <ol style="list-style-type: none"> <li>1) admin entry username and password to log in</li> <li>2) username and password is invalid</li> <li>3) show the message that username or password is invalid</li> </ol>

Exceptions	<p>3)a) Check if the customer or restaurant is registered with the system</p> <p>1) customer or restaurant not registered with the system</p> <p>2) ban request canceled</p> <p>3) use case resume on step 4</p> <p>4)a) Check reason for ban</p> <p>1) reason for ban not valid</p> <p>2) ban request canceled</p> <p>3) use case resume on step 4</p>
Assumptions	<p>1) Internet access available</p> <p>2) Logged in with a valid admin account</p> <p>3) Restaurant or customer registered in the system</p>
Special Requirements	N/A
Note and Issues	N/A

*Table 6 Use Case 4 Edit Menu*

Name	Edit menu
ID	2.1
Description	The staff using the order view system will have access to add delete or update items in the menu
Actors	staff
Frequency of use	medium

Triggers	<ol style="list-style-type: none"> <li>1) New item introduced to the menu</li> <li>2) Pricing changed for the items in the menu</li> <li>3) An item from the menu is taken out of the menu</li> </ol>
Pre-conditions	<ol style="list-style-type: none"> <li>1) Staff member logged in</li> <li>2) Details of the item must be present (Picture, name and price)</li> </ol>
Post conditions	Menu edited
Normal Flow	<ol style="list-style-type: none"> <li>1) Login</li> <li>2) Click edit menu</li> <li>3) Enter details</li> <li>4) Press submit button</li> </ol>
Alternative Flow	<ol style="list-style-type: none"> <li>1) Login</li> <li>2) Go to restaurant main menu</li> <li>3) Edit specific part of the menu(Deals or item)</li> <li>4) Use case resumed from step 3</li> </ol>
Exceptions	<ol style="list-style-type: none"> <li>1 a)login</li> <li>1) invalid username or password</li> <li>2)show message to re-enter username or password</li> <li>4a)press submit button</li> <li>1) item already exists in the menu</li> <li>2) item to delete is not present in the menu</li> <li>3) details are missing when adding an item</li> <li>4) missing details when updating item</li> </ol>

Special Requirements	N/A
Note and Issues	N/A

Table 8 Use Case 6 Report User

Name	Report user
ID	2.3
Description	This will help prevent the restaurant from the people who order and don't show up. The people who will not show up two times after ordering they can be banned
Actors	Staff, Database
Frequency of use	medium
Triggers	When the restaurant staff will generate the request using the command provided in the system
Pre-conditions	<ol style="list-style-type: none"> <li>1) Staff member logged in</li> <li>2) The customer to be reported is registered with the system</li> <li>3) Customer has not shown up twice after placing ad confirming the order</li> </ol>
Post conditions	The customer will be banned from ordering through this system
Normal Flow	<ol style="list-style-type: none"> <li>1) Login to the system</li> <li>2) check the name of customer in the list of registration</li> <li>3) check how many times he has missed his order</li> <li>4) write his id and name</li> <li>5) press ban button</li> <li>6) message shown saying customer xyz has been banned</li> </ol>
Alternative Flow	<ol style="list-style-type: none"> <li>3 a) check how many times he has missed his order</li> <li>1) customer did not miss 2 times</li> </ol>

	2) the ban request will be cancelled automatically
Exceptions	<ol style="list-style-type: none"> <li>1) the id or name is invalid</li> <li>2) the id entered is already banned</li> <li>3) use case will be resume from step 3</li> </ol>
Assumptions	<ol style="list-style-type: none"> <li>1) customer record is saved</li> <li>2) he has placed order a minimum of twice</li> <li>3) at least one restaurant has send a request for ban</li> </ol>
Special Requirements	
Note and Issues	

*Table 9 Use Case 7 Search Restaurant*

Name	Search restaurant
ID	3.1
Description	The customer can search for the restaurant where he wants to dine or he can search for the food he is looking for
Actors	Customer

Frequency of use	Medium
Triggers	When customer enters a name in search box and clicks search
Pre-conditions	<ol style="list-style-type: none"> <li>1) customer is online</li> <li>2) Customer is logged in</li> </ol>
Post conditions	The search returns all the places or food searched by customer
Normal Flow	<ol style="list-style-type: none"> <li>1) Customer logs in</li> <li>2) Goes to search box and enters a restaurant to search</li> <li>3) Press search button</li> <li>4) A list of places and food will show on screen to select</li> </ol>
Alternative Flow	<ol style="list-style-type: none"> <li>1) Customer logs in</li> <li>2) Goes to search box and enters a food item to search</li> <li>3) Press search button</li> <li>4) A list of places and food will show on screen to select</li> </ol>
Exceptions	<ol style="list-style-type: none"> <li>1) The food entered does not exist</li> <li>2) The restaurant does not exist</li> </ol>
Assumptions	<ol style="list-style-type: none"> <li>1) restaurant need to be in the list which user is searching</li> <li>2) customer search from application</li> </ol>
Special Requirements	N/A
Note and Issues	N/A

Table 10 Use Case 8 Search Deal

Name	Search deal
ID	3.3
Description	The customer can search for the deal where he wants to dine in
Actors	Customer
Frequency of use	Medium
Triggers	When customer enters a name in search box and clicks search
Pre-conditions	1) customer is online 2) Customer is logged in
Post conditions	The search returns all the deals related to the one entered
Normal Flow	1) Customer logs in 2) Goes to search box and enters a deal to search 3) Press search button 4) A list of places with deals and food will show on screen to select
Alternative Flow	1) Customer logs in 2) Goes to search box and enters a restaurant to search 3) Press search button 4) A list of restaurant will show on screen to select 5) customer will select the craving restaurant 6) customer will see the detail of the given restaurant

Exceptions	<p>1 a) The deal entered does not exist</p> <p>1) the message will show that deal is not in the menu</p> <p>2) use case will resume from step 3</p> <p>2a) The restaurant does not exist</p> <p>1) the message will show that restaurant is not in the list</p> <p>2) use case will resume from step 3</p>
Assumptions	
Special Requirements	
Note and Issues	

*Table 11 Use Case 9 Report Restaurant*

Name	Report Restaurant
ID	3.4

Description	This will give restaurant a warning to be careful and take care of their customers. If more than 10 % of people visiting have reported the restaurant it will be put on priority for a period of time
Actors	Customer, Database
Frequency of use	Medium
Triggers	When the customer will generate the request using the command provided in the app or web page
Pre-conditions	<ol style="list-style-type: none"> <li>1) customer logged in</li> <li>2) The restaurant to be reported is registered with the system</li> <li>3) the time mentioned for the order to be served was delayed</li> </ol>
Post conditions	The restaurant will be put on priority
Normal Flow	<ol style="list-style-type: none"> <li>1) Login to the system</li> <li>2) check the name of restaurant in the list of registration</li> <li>3) check how many times the order is delayed</li> <li>4) write restaurant name and location</li> <li>5) press ban button</li> <li>6) message shown saying restaurant xyz has been banned</li> </ol>
Alternative Flow	<ol style="list-style-type: none"> <li>3) check how many times he has missed his order <ol style="list-style-type: none"> <li>a) restaurant delayed the order 3 times</li> <li>b) the ban request will be cancelled automatically</li> </ol> </li> </ol>
Exceptions	<ol style="list-style-type: none"> <li>1) the restaurant name and location is invalid</li> <li>2) the restaurant is already banned</li> </ol>

Assumptions	<ol style="list-style-type: none"> <li>1) restaurant record is saved</li> <li>2) at least 10% of customers visiting restaurant have send a request for ban</li> </ol>
Special Requirements	
Note and Issues	

*Table 12 Use Case 10 Feed Back*

Name	Feedback
ID	3.5
Description	The customer can give their feedback about the restaurant which will show in the slider in feedback section
Actors	Customer
Frequency of use	Medium
Triggers	When user going to give the feedback about the restaurant
Pre-conditions	<ol style="list-style-type: none"> <li>1. User need to login in the system</li> <li>2. User must give his email</li> </ol>
Post conditions	<ol style="list-style-type: none"> <li>1. The user feedback show on the website</li> </ol>
Normal Flow	<ol style="list-style-type: none"> <li>1. The user will press login button</li> </ol>

	<ol style="list-style-type: none"> <li>2. The user will enter the username and password</li> <li>3. If the username and password is valid then it will login</li> <li>4. User will go to the feedback section</li> <li>5. If he wants to give feedback, he will leave comment</li> <li>6. User must need to give a valid email address</li> <li>7. The feedback will be show in the slider</li> </ol>
Alternative flow	<p style="text-align: center;">5a) user give feedback</p> <ol style="list-style-type: none"> <li>1. The feedback goes to the staff</li> <li>2. They will choice which feedback to show on the website section</li> <li>3. Use case will remain from step 5</li> </ol>
Exceptions	<p style="text-align: center;">6a) user give email address</p> <ol style="list-style-type: none"> <li>1. Email invalid</li> <li>2. Show message that email is invalid give valid email</li> </ol>
Assumptions	User have the email address
Special requirements	N/A

Notes and Issues	N/A

## 5. IMPLEMENTATION DETAILS

### 5.1 Development Setup

List your tools and technologies and their role in development.

The following languages were used in the development of Order Time

1. Java (for backend of android application )
2. XML (for front end of android application)
3. JASON (for android server side and database management )
4. HTML (for front end of web portal )
5. CSS (for front end of web portal)
6. PHP(for backend of web portal)
7. MySQL (Web Database Creation and Management )
8. Bootstrap (for dynamic responsiveness of the web portal)

The following tools were used in the development of Order Time

1. Android Studio
2. Sublime Text
3. Dreamweaver
4. XAMPP

Description

1. Android Studio: This tool was used for mainly all our android development. Using this *tool XML File* (Interface of the application) were assembled along with the java classes to run these XMLs. Moreover online module like Firebase and Facebook login modules were integrated into project

2. Sublime Text: This tool was used to do the mixture of front and back end web development for Order time.

3 Dreamweaver: This tool was used to make the most of the front end of the Order Time website. Modules like sliders and animations in the website were integrated in the project using this tool

4 XAMPP: This tool was used to develop the backend i.e. the database of the project. The tables and the relationship between them were integrated into the project using this tool.

The following APIs and Prefab Modules have been integrated into the project

1. Facebook API
2. Google Map API
3. Firebase

## 5.2 Deployment setup

We have not yet deployed your project yet. But it will be soon online on Bean Bag Studios on Play Store after the design changing recommended by the restaurants and the software house who are sponsoring this project

We faced a lot of problems during the development of the project but guidelines from the experienced developers at Aresoft Solution and through some websites like Stack Overflow, google and YouTube we found the solutions for all the debugging and error handling.

Moreover, Most of the project was developed at Aresoft Solution under the supervision of a team lead

## 5.3 Constraints

The following constraints are for the customer's side users of the project

1. Customer must login in the application or website before placing the order
2. Customer must be connected to the internet until receiving the confirmation notification of the application or website
3. Customer can place order corresponding to only one restaurant at a time
4. Customer can cancel the order only in first 5 minutes after the confirmation notification
5. Customer cannot add a waiting time of more than 90 min
6. Customer current location should be in 90 min travel distance of the corresponding order restaurant

7. Customer cannot cancel more than 3 order. On doing so they will be banned from the application
8. Customer must rate the experience to finish the current order and start the next order
9. Customer must arrive at the restaurant with the device running order time using which order was placed
10. Customer must place a minimum order of RS. 200

The following constraints are for the restaurant side users of the project

1. Restaurant sides must review every order request within 5 minutes or else one penalty point will be added to the restaurant profile
2. Restaurant must provide a reason on cancelling an order
3. Restaurant can only cancel 20 orders per day. On doing more rejection will ban the restaurant for the day after which the restaurant will not be available on the website or application
4. Restaurant must enter the customer arrival time to finish off the corresponding order
5. Restaurant must change their status on closing the restaurant so that suitable changes could be made on the website and application

The following constraints are for the admin side users of the project

1. Admin must respond to the views accordingly

### 5.3.1 Assumptions

Every user of the website or android application must stay connected to the internet until the completion or cancellation of the order

Customer will wait for confirmation notification after placing the order

The order placed will be shown in the admin side

The order cancellation will remove the order from the making

The system will be stand alone and will be deployed on a server

The client side (restaurant) it is further assumed that the deployment environment is capable of supporting an IEEE 802.11 wireless network for system communication will use our services online

When customer will click on add that item will go into shopping cart and user can see it order from shopping cart

### **5.3.2 System constraints**

Internet Connection: Our project works online using databases and server. To connect to the server internet connection is must.

### **5.3.3 Restrictions**

All the devices must be connected to internet for server connectivity otherwise the system will not run

### **5.3.4 Limitations**

Our System don't handle home delivery service. It is an purely pre reservation project

## 6. TESTING

### 6.1 Extended Test Cases

Table 14 Test Case Login

Test case ID: 1		Test Design By: <b>Osama Fayyaz</b>				
Test Module Name: <b>Login</b>		Test Design Date: <b>7/26/2017</b>				
Test Priority: <b>High</b>		Test Executed By: <b>Osama Fayyaz</b>				
Test Title/Name: <b>login</b>		Test Executed Date: <b>7/26/2017</b>				
Description: <b>user will enter valid username and password and then user will get the access to place the order</b>						
Precondition: <b>Internet Access, valid username and password</b>						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass /Fail)	Notes
1	<b>Open the website.</b>				<b>pass</b>	
2	<b>click on the login icon</b>					
3	<b>Fill the given text field all text fields should be filed.</b>	<b>Email</b> <b>ali@gmail.com</b> <b>Password</b> <b>12345678</b>				

4	click on login in button	User will entry in the website.	User is successfully entry in the website.
Post Condition: user successfully login in website			

Table 15 Test Case Sign Up

Test case ID: 2		Test Design By: Osama Fayyaz				
Test Module Name: Sign up		Test Design Date: 7/26/2017				
Test Priority: High		Test Executed By: Osama Fayyaz				
Test Title/Name: Sign up to register in the database		Test Executed Date: 7/26/2017				
Description: user need to sign before login if user already registered in the database then user does not need to sign up this test case is about unique user name when sign it should register in database						
Precondition: internet , username and email should be unique						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	Open the website.				pass	

2	click on the login here				
3	Go to the sign up fill the given text field all text fields should be filed.	user name Osama email <u>osama@gmail.com</u> phone no: 03364348849 password 12345678			
4	click on login in button		User will register in the database and confirmation message will be display.	User will successfully register in the database and confirmation message will be display.	
Post Condition: user successfully register in the website					

Table 16 Test Case choose Restaurant

Test case ID: 3	Test Design By: Osama Fayyaz
Test Module Name: choose restaurant	Test Design Date: 7/26/2017
Test Priority: High	Test Executed By: Osama Fayyaz

Test Title/Name: <b>test when we click on given restaurant it take user to given restaurant page</b>		Test Executed Date: <b>7/26/2017</b>				
Description: <b>when user click on restaurant name it will take it to given page</b>						
Precondition: <b>internet</b>						
Dependencies:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	<b>Open the website.</b>				<b>pass</b>	
2	<b>click on the restaurant name</b>					
3	<b>user will go to the chosen restaurant page</b>	<b>chosen restaurant page need to be open</b>	<b>restaurant page is opened</b>			
Post Condition: <b>user successfully go to the restaurant page</b>						

*Table 17 Test Case Place Order*

Test case ID: <b>4</b>	Test Design By: <b>Osama Fayyaz</b>
Test Module Name: <b>place order</b>	Test Design Date: <b>7/26/2017</b>
Test Priority: <b>High</b>	Test Executed By: <b>Osama Fayyaz</b>

Test Title/Name: <b>place order and it add in the cart</b>			Test Executed Date: <b>7/26/2017</b>			
Description: <b>when user place the order given item should add in the cart</b>						
Precondition: <b>internet , user need to login in the system</b>						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	Go to the mean.				pass	
2	choose the menu					
3	click on the item it will take it to the item detail					
4	click on the add to cart button		Item will add to the cart.	item successfully add into the cart		
Post Condition: <b>item add into the cart</b>						

*Table 18 Test Case Confirm Order*

Test case ID: <b>5</b>	Test Design By: <b>Osama Fayyaz</b>
Test Module Name: <b>confirm order</b>	Test Design Date: <b>7/26/2017</b>

Test Priority: High			Test Executed By: Osama Fayyaz			
Test Title/Name: when it click on the confirm order should be placed			Test Executed Date: 7/26/2017			
Description: user give information and then press confirmation and order should be placed						
Precondition: internet , some item should be add in the cart						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	Open the cart.				pass	
2	click on the continue button					
3	give the information all filed should be field .	full name soma Fayyaz Email Address <u>osma@gmail.com</u> Mobile NO 03364348989 city Lahore Pin code 123456 Address UMT				

4	click on place order		Order will be placed and user can see the status.	order is placed		
<b>Post Condition: order is placed and user can see the status of it order</b>						

*Table 19 Test Case Cancel Order*

Test case ID: 6			Test Design By: <b>Osama Fayyaz</b>			
Test Module Name: <b>Cancel order</b>			Test Design Date: <b>7/26/2017</b>			
Test Priority: <b>Medium</b>			Test Executed By: <b>Osama Fayyaz</b>			
Test Title/Name: <b>Cancel order</b>			Test Executed Date: <b>7/26/2017</b>			
Description: <b>when user placed it order user can cancel order but if it confirm</b>						
Precondition: <b>internet , order is placed</b>						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	<b>Order is placed.</b>				<b>pass</b>	

2	click on cancel order button					
3	order is canceled		order is canceled	status is changed to cancelled		
<b>Post Condition: order is cancelled</b>						

*Table 20 Test Case Test Case Test Case View Order*

Test case ID: 7			Test Design By: Osama Fayyaz			
Test Module Name: <b>view order and change status of the order</b>			Test Design Date: 7/26/2017			
Test Priority: <b>High</b>			Test Executed By: Osama Fayyaz			
Test Title/Name: <b>view order and status</b>			Test Executed Date: 7/26/2017			
Description: <b>restaurant admin can see the order and can change it status</b>						
Precondition: <b>internet , login as admin</b>						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	<b>Open the admin site.</b>				<b>pass</b>	

2	click on the order				
3	admin can see all the order and can click on the change status to change the status	1 : Processing 2 : Processed 3 : Shipped 4 : Delivered 5 : Canceled 6 : Returned			
4	click on update		The chosen status will be updated.	the status is updated	
<b>Post Condition: order status is updated</b>					

*Table 21 Test Case Add New Category*

Est case ID: 8	Test Design By: <b>Osama Fayyaz</b>
Test Module Name: <b>add new category</b>	Test Design Date: <b>7/26/2017</b>
Test Priority: <b>High</b>	Test Executed By: <b>Osama Fayyaz</b>
Test Title/Name: <b>new category</b>	Test Executed Date: <b>7/26/2017</b>
Description: <b>restaurant admin can add new category in the menu</b>	
Precondition: <b>internet , login as admin</b>	
Dependences:	

Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	click on the category				pass	
2	from drop down menu click on add category					
3	give the information to add the new category in the menu	name drinks image pic1.png				
4	click on add category		New category add in menu.	new category add in menu		
<b>Post Condition: new category is made in menu</b>						

*Table 22 Test Case Add New Product*

Test case ID: 9	Test Design By: Osama Fayyaz
Test Module Name: add new product	Test Design Date: 7/26/2017
Test Priority: High	Test Executed By: Osama Fayyaz
Test Title/Name: new product	Test Executed Date: 7/26/2017

Description: **restaurant admin can add new product in the category**

Precondition: **internet , login as admin**

Dependences:

Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	click on the product				pass	
2	from drop down menu click on add product					
3	give the information to add the new product in the menu	product name item 1 product image image2.png product description serve 1 market price 800 selling price 1000 select category				

4	click on add product		New product add in category.	new product add in category		
Post Condition: new category is made in menu						

Table 23 Test Case Delete Product

Test case ID: 10			Test Design By: Osama Fayyaz			
Test Module Name: delete product			Test Design Date: 7/26/2017			
Test Priority: High			Test Executed By: Osama Fayyaz			
Test Title/Name: delete product			Test Executed Date: 7/26/2017			
Description: delete product						
Precondition: internet , login as admin						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	click on the view product				pass	
2	click on delete product	product will be deleted	product is deleted			
Post Condition: product is deleted						

4	click on add product		New product add in category.	new product add in category		
Post Condition: new category is made in menu						

Table 23 Test Case Delete Product

Test case ID: 10			Test Design By: Osama Fayyaz			
Test Module Name: delete product			Test Design Date: 7/26/2017			
Test Priority: High			Test Executed By: Osama Fayyaz			
Test Title/Name: delete product			Test Executed Date: 7/26/2017			
Description: delete product						
Precondition: internet , login as admin						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	click on the view product				pass	
2	click on delete product	product will be deleted	product is deleted			
Post Condition: product is deleted						

**Android app**

*Table 24 Test Case Login with Facebook*

Test case ID: 11			Test Design By: <b>Osama Fayyaz</b>			
Test Module Name: <b>login with Facebook</b>			Test Design Date: <b>7/26/2017</b>			
Test Priority: <b>High</b>			Test Executed By: <b>Osama Fayyaz</b>			
Test Title/Name: <b>Facebook login</b>			Test Executed Date: <b>7/26/2017</b>			
Description: <b>in android app user can login with Facebook account</b>						
Precondition: <b>internet , Facebook application in mobile</b>						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	<b>go to login menu</b>				<b>pass</b>	
2	<b>click on continue Facebook</b>					
3	<b>login in with Facebook</b>		<b>login with Facebook conformatio n dial box show the message</b>	<b>successfully login with Facebook</b>		

**Post Condition: user login with Facebook account**

*Table 25 Test Case Map*

Test case ID: 12		Test Design By: <b>Osama Fayyaz</b>				
Test Module Name: <b>map</b>		Test Design Date: <b>7/26/2017</b>				
Test Priority: <b>High</b>		Test Executed By: <b>Osama Fayyaz</b>				
Test Title/Name: <b>current location</b>		Test Executed Date: <b>7/26/2017</b>				
Description: <b>map will pinpoint your current location through GPS</b>						
Precondition: <b>internet , mobile device GPS is on</b>						
Dependences:						
Step	Test Step	Test Data	Expected Result	Actual Result	Status(Pass/Fail)	Notes
1	<b>login</b>				<b>pass</b>	
2	<b>map will show your current location</b>		<b>show your current location</b>	<b>it show the accurate location</b>		
Post Condition: <b>you can see you location on map</b>

## 6.2 Decision Table

### 6.2.1 Code snippet

#### 6.2.1.1 Google Map Customization

```
if (mGoogleApiClient != null) {
    LocationServices.FusedLocationApi.removeLocationUpdates(mGoogleApiClient, this);
}

//Place current location marker
LatLng latLng = new LatLng(location.getLatitude(), location.getLongitude());
Global.getInstance().mylocation=latLng;
MarkerOptions markerOptions = new MarkerOptions();
markerOptions.position(latLng);
markerOptions.title("Current Position");

markerOptions.icon(BitmapDescriptorFactory.defaultMarker(BitmapDescriptorFactory.HUE_M
AGENTA));

//move map camera
if (i==0) {
    for (int i = 0; i < Global.getInstance().places.size(); i++) {
        addmarkerf(Global.getInstance().places.get(i));
    }

    map.moveCamera(CameraUpdateFactory.newLatLng(latLng));
    map.animateCamera(CameraUpdateFactory.zoomTo(15));
    i = 1;
}
7.
```

#### 6.2.1.2 Custom info Window on Map

```
Deleter= new Dialog(HomeActivity.this);
Deleter.requestWindowFeature(Window.FEATURE_NO_TITLE);
```

```

Deleter.setContentView(R.layout.activity_resturant_single);
for (int i=0;i<Global.getInstance().places.size();i++){
    if (marker.getTitle().equals(Global.getInstance().places.get(i).getName())){
        temp=Global.getInstance().places.get(i);
    }
}
TextView tname = (TextView) Deleter.findViewById(R.id.tv_tree_name);
TextView tlocation = (TextView) Deleter.findViewById(R.id.tv_tree_location);
TextView trate = (TextView) Deleter.findViewById(R.id.tv_tree_date);
final Button rate = (Button) Deleter.findViewById(R.id.bt_enter);
Button order = (Button) Deleter.findViewById(R.id.bt_tree_edit);
tname.setText(temp.getName());
tlocation.setText(temp.getAddress());
trate.setText(temp.getRate());

```

### 6.2.1.3 Android Device Version Check and Getting Permission

```

if (Build.VERSION.SDK_INT >= Build.VERSION_CODES.M) {
    if (ContextCompat.checkSelfPermission(this,
        android.Manifest.permission.ACCESS_FINE_LOCATION)
        == PackageManager.PERMISSION_GRANTED) {
        buildGoogleApiClient();
        map.setMyLocationEnabled(true);
        // progress.
        // hide();
    }
} else {
    buildGoogleApiClient();
    map.setMyLocationEnabled(true);
}

```

## 7.1 Traceability Matrix

### 7.1.1 RID vs UCID (requirements vs use cases)

Table 28 6.3.1 RID vs UCID

UCID/RID	R1	R2	R3	R4	R5	R6	R7	R8	R9	R10	R11	R12	R13	R14	R15	R16
UC1	<input checked="" type="checkbox"/>									<input checked="" type="checkbox"/>						
UC2		<input checked="" type="checkbox"/>														
UC3			<input checked="" type="checkbox"/>											<input checked="" type="checkbox"/>		
UC4	<input checked="" type="checkbox"/>				<input checked="" type="checkbox"/>			<input checked="" type="checkbox"/>								
UC5	<input checked="" type="checkbox"/>										<input checked="" type="checkbox"/>					
UC6									<input checked="" type="checkbox"/>							<input checked="" type="checkbox"/>
UC7	<input checked="" type="checkbox"/>														<input checked="" type="checkbox"/>	
UC8						<input checked="" type="checkbox"/>										
UC9		<input checked="" type="checkbox"/>									<input checked="" type="checkbox"/>					
UC10													<input checked="" type="checkbox"/>			
UC11				<input checked="" type="checkbox"/>			<input checked="" type="checkbox"/>									
UC12												<input checked="" type="checkbox"/>				<input checked="" type="checkbox"/>

### 7.1.2 Prototypes (RID vs PID)

Table 29 RID vs PID

PID/RID	R1	R2	R3	R4	R5	R6	R7	R8	R9	R10	R11	R12	R13	R14	R15	R16
PID1	<input checked="" type="checkbox"/>												<input checked="" type="checkbox"/>			
PID2																<input checked="" type="checkbox"/>
PID3							<input checked="" type="checkbox"/>				<input checked="" type="checkbox"/>					
PID4		<input checked="" type="checkbox"/>														
PID5			<input checked="" type="checkbox"/>					<input checked="" type="checkbox"/>							<input checked="" type="checkbox"/>	
PID6													<input checked="" type="checkbox"/>			

PID7					<input checked="" type="checkbox"/>												
PID8	<input checked="" type="checkbox"/>																<input checked="" type="checkbox"/>
PID9												<input checked="" type="checkbox"/>					
PID10	<input checked="" type="checkbox"/>																
PID12						<input checked="" type="checkbox"/>				<input checked="" type="checkbox"/>							
PID13			<input checked="" type="checkbox"/>													<input checked="" type="checkbox"/>	

### 7.1.3 Test Cases (RID vs TID)

Table 30 RID vs TID

TID 10	<input checked="" type="checkbox"/>			<input checked="" type="checkbox"/>												
TID 12						<input checked="" type="checkbox"/>				<input checked="" type="checkbox"/>						
TID 13			<input checked="" type="checkbox"/>												<input checked="" type="checkbox"/>	
TID 14							<input checked="" type="checkbox"/>									

## 8. RESULTS/OUTPUT/STATISTICS

### 8.1 %completion

Our Project is 95% complete

Order Time

Functional Specification

Version <2.0>

## 8.2 %accuracy

Our project is 90% accurate.

## 8.3 %correctness

Our project is 99% correct

## 9. CONCLUSION

The project Order Time is the pre order highly desired by specially office people who have around 1 hour lunch break in their working hours. Using this service these people are able to have enough time to go out and have lunch outside of their work space without any issue. It takes a lot of time to get your launch by placing an order after arriving at the place within one hour. Using this service the time used in travel is also used to cook the order so that one's orders could be served on the table before his arrival at the place

Order Time is a web plus android application where all users (Admin, customers, restaurant, and manager) can register themselves through signup process. Customer can edit their profile whereas user's i.e. restaurant managers need to request admin through email for any permission or profile modification. Customer has different places options to place their order which include restaurants, fast food chains and bakery who are registered with our project. They can view their menu and new deals published on the project server by the restaurant manage. Facilities like google Map, directions, navigation and facebook share and sign in are also integrated into the project android application

## 9. CONCLUSION

The project Order Time is the pre order highly desired by specially office people who have around 1 hour lunch break in their working hours. Using this service these people are able to have enough time to go out and have lunch outside of their work space without any issue. It takes a lot of time to get your launch by placing an order after arriving at the place within one hour. Using this service the time used in travel is also used to cook the order so that one's orders could be served on the table before his arrival at the place

Order Time is a web plus android application where all users (Admin, customers, restaurant, and manager) can register themselves through signup process. Customer has different places options to place their order which include restaurants, fast food chains and bakery who are registered with our project. They can view their menu and new deals published on the project server by the restaurant manage. Facilities like google Map, directions, navigation and facebook share and sign in are also integrated into the project android application

## 10. FUTURE WORK

In future we plan to take this project to the next level by adding facilities like choosing your table on both portals i.e. website and android along with the option to track customer in real time so that the restaurant owner can take steps and do preparation accordingly. On the admin side we plan to integrate an AI algorithm which can automatically separate bad remarks or complain from all the feedback from customers or restaurant managers. This will decrease the need of manpower to run this project in real time
